Mandibular Advancement Splint
Oral and Maxillofacial Surgery

We can provide interpreters for a variety of languages, information in larger print or other formats (e.g. audio) - please call us on 01932 723553.

To use the Text Relay service, prefix all numbers with 18001.
Further Information

We endeavour to provide an excellent service at all times, but should you have any concerns please, in the first instance, raise these with the Matron, Senior Nurse or Manager on duty. If they cannot resolve your concern, please contact our Patient Advice and Liaison Service (PALS) on 01932 723553 or email pals@asph.nhs.uk. If you still remain concerned please contact our Complaints Manager on 01932 722612 or email complaints@asph.nhs.uk.
HOW SUCCESSFUL ARE THEY?

Not everybody can tolerate this device. Approximately 70-80% of patients are able tolerate them and of that figure a significant proportion gain varying degrees of relief.

FURTHER INFORMATION

Information or advice regarding this splint can be obtained by contacting St. Peter’s Hospital – telephone 01932 87200 ext. 2493 or Ashford Hospital – telephone 01784 884009.

Additional information can also be obtained by logging on to http://www.baoms.org.uk/sitemap.asp?id=20

Mandibular Advancement Splint

WHAT IS A MANDIBULAR ADVANCEMENT SPLINT?

A mandibular advancement splint is custom made to fit over your upper and lower teeth at the same time. It has been constructed to bring your lower jaw forward during sleep and this in turn will open your upper airway to allow air to flow more freely. It is thought to work by reducing the air turbulence and hence reducing the “snore”. The device DOES NOT move your jaw forward permanently, it will only hold your jaw forward during sleep. Most patients wish to try this device as it is the most conservative (non-surgical) form of treatment.

You have been supplied with this type of splint to treat your sleep related disorder, which can range from simple snoring to mild/moderate obstructive sleep apnoea.

HOW WILL I GET USED TO IT?

Do NOT try to sleep with the device initially. Wear it for an hour or so for a period when you are relaxed e.g. watching TV. This will allow a period of acclimatisation, during which time you may notice that your saliva production increases dramatically. This is quite normal and will reduce in time.
**WILL IT STAY IN ALL NIGHT?**

Some people have a strong lower jaw and can dislodge the device from the lower teeth. Application of a thin layer of denture adhesive such as “Polygrip” to the inside of the splint tends to overcome this.

Some individuals remove the device subconsciously during sleep. There is no way of overcoming this.

**ARE THERE ANY ALTERNATIVES AVAILABLE?**

CPAP (positive pressure to the airways) can be tried under the supervision of a respiratory physician.

Surgery to the soft palate is sometimes recommended. This would be done by an Ear, Nose and Throat surgeon.

**HOW DO I LOOK AFTER IT?**

The device is thermoplastic. This means heat will distort it. **Do NOT** use hot water to clean it; use cold water and a soft brush. Some patients use products such as “Retainer Brite” or “Steradent”. Remember to use cold water only.

Keep in a cool/ safe place. If you have also been given your casts, then store the device on them as it is difficult to lose the complete set.

The life span of this device is about 18 months and usually fails due to de-bonding of the upper and lower segments. It will then be replaced.

You may notice a slightly dry mouth/ lips in the morning. In order to avoid this, apply a copious layer of Vaseline to your lips prior to sleep.

**ARE THERE ANY SIDE EFFECTS?**

Apart from the increase in saliva production, you may notice that when you wake in the morning you have a minor ache in the muscles at the side of your lower jaw. This again is quite normal. For the first week or so you may need to take a simple painkiller such as Paracetamol.

If you continue to have morning pain after a couple of weeks you should discontinue wearing your device until after your planned review at the hospital.

You will notice the breathing hole in the front of the device. You will be able to breathe quite normally. Don’t worry; you will NOT be able to swallow this device!

**WILL I BE ABLE TO BREATHE NORMALLY WITH THE DEVICE IN PLACE?**

You will notice a slightly dry mouth/ lips in the morning. In order to avoid this, apply a copious layer of Vaseline to your lips prior to sleep.

Some individuals remove the device subconsciously during sleep. There is no way of overcoming this.
