Compiled by: Sue Curry, Haematology Nurse Specialist
In consultation with: Infection Prevention and Control Team
Ratified by: Clinical Governance Committee
Date ratified: 1st December 2011
1st Review: August 2013
2nd Review: April 2016
Reviewed by: Prodine Kubalalika
Review date: April 2018
Target audience: All Trust staff
Impact Assessment carried out by: Linda Towey, Consultant Nurse, Infection Prevention & Control
Comments on this document to: Ann Trail, Nurse Consultant, Infection Prevention & Control
1. INTRODUCTION

Bloodstream infections associated with intravascular access devices are potentially among the most dangerous complications of healthcare that can occur, worsening the severity of the patients underlying ill health, prolonging the period of hospitalisation and increasing the cost of care. Almost 64% of patients in the UK with an intravascular device acquire a catheter related bloodstream infection (CR-BSI) (HPA 2012).

2. PURPOSE

The number of patients requiring central venous access continues to grow as the management of disease and trauma improves and life expectancy is prolonged. PICCs are used for many patients in a wide array of circumstances, so establishing and maintaining safe, appropriate and reliable access and care for this group of patients is vital. This policy outlines measures that will be implemented to reduce the risk of infection in any adult with a PICC.

3. BACKGROUND

Patients requiring PICC lines are particularly prone to infections, therefore meticulous care needs to be taken when handling the lines. Aseptic technique must be used at all times.

This policy is to ensure that there is standard high quality care of PICC lines in the Trust with an overall aim of minimising the risk of infection.

It can be used for the delivery of cytotoxic therapy, parenteral nutrition, therapy requiring central access or long term antibiotic therapy (greater than four weeks). It is also possible to deliver blood products via a PICC.

A PICC can be used by any nurse/doctor who has been assessed as both competent to administer intravenous therapy and competent in caring for PICC lines (see Appendix 1).

4. SELECTION OF CATHETER INSERTION SITE

PICC lines are inserted in the Radiology department.

A PICC is a central catheter inserted usually using the basilic vein into the superior vena-cava. As the basilic vein is not visible high resolution ultrasound is used to puncture the vein and confirm the eventual line position.

Once inserted the position of the line must be checked radiographically before use.
5. **ASEPSIS**

An aseptic technique is required throughout the procedure.

6. **SKIN PREPARATION**

The patient’s skin, if not visibly clean, should be cleaned with soap and water. Shaving of the skin should be avoided. If hair removal is considered necessary clipping is the preferred option using a disposable clipper head (Elliot 2001). Decontaminate the skin site with 2% Chlorhexidine gluconate/70% isopropyl alcohol (Chloraprep 3ml) applying gentle friction disinfect the skin site for 30 seconds and allow to dry prior to the insertion of the PICC. Use a single patient application of alcoholic povidone iodine application for patients with a history of Chlorhexidine sensitivity. Allow the antiseptic to dry before inserting the PICC.

7. **SECURING LINE**

A PICC is secured in place using a statlock. These should be changed at each dressing renewal and extreme care is required when doing this to avoid dislodgement of the line.

8. **DRESSING OF LINE**

The catheter is further secured in position using a semi permeable polyurethane sterile transparent dressing. The dressing should be changed weekly unless otherwise indicated. Decontaminate hands and use an aseptic non touch technique when changing the dressing. Prior to cleaning check PICC line has not migrated out of the exit site i.e. remains placed up to the hilt as when first inserted. The exit site should be cleaned with ChloraPrep (3mls) and allowed to dry for 30 seconds before applying a semi permeable transparent film dressing. A sterile gauze dressing may be used if the insertion site is oozing or when the dressing is loose, damp or soiled. The gauze dressing must be changed every 24 hours.

Dressings should be changed by a registered nurse with a competency in this procedure.

9. **BIONECTOR DEVICE**

Following insertion a bionector/TKO will be placed on the end of the device. This needs to be changed every seven days. At the end of the bionector/TKO a CUROS cap will be placed. This is a single use device with 70% alcohol and 2% chlorhexidine and MUST BE REPLACED AFTER EVERY ACCESS OF THE LINE. There is no need to further disinfect the end of the bionector/TKO prior to use.
10. **DOCUMENTATION**

Document line insertion in health care records including:

- Date of device insertion
- Type of device inserted
- Insertion site and catheter size
- Name of person inserting device
- Insert product label into patient’s notes
- Core care plan to be inserted in patients’ nursing notes following PICC insertion

11. **SITE ASSESSMENT**

Patients shall be encouraged to report any changes in their catheter site or any new discomfort to nursing and medical staff. A patient information leaflet should be given whenever possible.

A nurse shall assess the PICC site at least 8 hourly for signs of infiltration, phlebitis or infection; including pain, redness, swelling, induration, disruption when appropriate.

If gauze dressing is being utilised, assess for phlebitis and infection at time of dressing change.

If a localised infection is suspected at the PICC insertion site the medical staff shall be informed and a bacterial culture of the site sent. Line should be removed if systemic line infection suspected and the tip then sent for bacterial culture.

The entry site assessment shall be documented on the CVAD daily monitoring form.

12. **ACCESSING/FLUSHING A PICC LINE**

12.1 **PICC line in frequent use (at least once a day)**

- Wash hands thoroughly with soap and water and dry hands.
- Gather all equipment needed including a dressing trolley and a dressing pack.
- Aseptic technique must be used at all times when accessing the line.
- Remove CUROS and discard. No further disinfection required.
- If CUROS not in use disinfect bionector/TKO with 2% chlorhexidine/70% alcohol wipe.
- Aspirate and discard 5 - 10mls of blood to confirm patency prior to administration of medications. The patency of the line will be checked prior to administration of medications and/or solutions, however there is no requirement to routinely draw blood and discard prior to flushing.
• Flush with 10mls of 0.9% sodium chloride using a push-pause technique to maintain patency. Do not use anything smaller than a 10ml syringe.
• Administer medications.
• If more than one drug, flush between each drug.
• At the end of drug administration finish by flushing with 10mls of normal saline using a push-pause technique ensuring positive pressure is maintained in the lumen, with the final 1ml then clamp the line before removing the syringe to prevent backflow of blood into the line.

12.2 PICC line NOT in frequent use (used once a week)
• Wash hands thoroughly with soap and water and dry.
• Gather all equipment needed including a dressing trolley and a dressing pack
• Aseptic technique must be used at all times when accessing the line.
• Remove CUROS and discard. No further disinfection required.
• If CUROS not in use disinfect bionector/TKO with 2% chlorhexidine/70% alcohol wipe.
• Aspirate line and flush each lumen with 10mls non saline then flush each lumen with Heparin Sodium solution 10 units in 1ml (i.e. 50 units in 5mls for each lumen).
• Dressings including statlock must be changed every seven days. Clean around the site with Chloraprep (3mls), allow it to dry for 30 seconds before applying a new dressing.

13. DRAWING BLOOD

Taking blood from a PICC line
• Wash hands thoroughly with soap and water and dry.
• Gather all equipment needed including a dressing pack and a sharps bin.
• Aseptic technique must be used at all times when accessing the line.
• Remove CUROS and discard. No further disinfection required.
• If CUROS not in use disinfect bionector/TKO with 2% chlorhexidine/70% alcohol wipe.
• Aspirate and discard 5-10mls of blood.
• Using the vacutainer system withdraw the required amount of blood.
• Flush with 10mls of 0.9% sodium chloride using the push-pause technique.

When taking blood cultures DO NOT pre-flush the line and DO NOT discard the first 5-10mls of blood

Refer to Blood Culture Taking Policy
14. **CONNECTION TUBING**

Administration sets should be changed as per Trust policy:

- TPN – every 24 hours
- Blood/blood components – changed when transfusion is completed or every 12 hours whichever is sooner. A new giving set must be used prior to administration if any other infusions
- Non-additive solutions – every 72 hours unless disconnected from the line

15. **ADMINISTRATION OF FLUIDS**

Except in the operating department and in emergency situations, all fluids, where possible, shall be administered by infusion pumps. Patients who are receiving fluids with potassium or patients who have known cardiac disease should have fluids administered via an infusion pump.

16. **REMOVAL OF PICC**

The decision to remove the PICC should be made by the medical staff. Only staff who have demonstrated competency may remove a PICC line. The dressing should be removed and gentle pressure applied to the line. It should pull out easily, (the line is marked at 1cm intervals).

The patient must be lying in a supine position and precautions to prevent air embolism must be taken when removing the line.

If the line does not pull out easily, gentle traction and a warm compress can be applied to alleviate venous spasm, if resistance continues stop and notify the medical team.

Document the date of catheter removed in the nursing and medical notes.

17. **TROUBLESHOOTING**

Redness of the upper arm. This is likely to be PICC line mechanical phlebitis. Contact the medical team or haematology unit nurses. Take blood culture from the line and haematology unit nurses. Take blood culture from the line and peripheral to exclude infection. Swab exit site if exudate present and treat with intravenous antibiotics via the line as per the Trust’s Antibiotic Guidelines.

If oedema of the arm, shoulder, neck or face occurs, thrombosis should be excluded. If thrombosis is proven, line should be removed and the patient should be anti-coagulated.
18.  UNBLOCKING THE LINE WITH UROKINASE

The decision to unblock the line using this method must be discussed with a senior clinician or haematology unit nurse.

- If you suspect a PICC has become blocked, check for mechanical obstruction before an attempt is made to unblock the line
  - Check any sutures are not too tight
  - Check the line is not kinked
  - Check the line has not migrated out
  - Change the bionector/TKO

**Do not use hepsal to unblock PICC lines** – for advice please contact Haematology Specialist Nurses

- If unable to unblock and the cause of the occlusion is blood, please discuss with the Medical Team/Haematology Specialist Nurses and consider using Urokinase 5000 units in 2mls of 0.9% sodium chloride.
- Dilute 5000 units Urokinase with 2 mls of 0.9% sodium chloride
- Using a push –pause technique, instil solution with a 10mls syringe
- Leave the solution in situ for one to two hours (do not use the line during this time)
- Aspirate and discard 5mls of blood and then flush with 20mls of 0.9% sodium chloride.
- If unsuccessful, leave the Urokinase solution for four hours and repeat the above.
- Urokinase can be left in situ for twenty four hours.

**Urokinase MUST be prescribed prior to administration**
**Only staff who are competent to undertake this procedure should perform this**

If urokinase does not work (and the line is not infected) discuss with the Consultant Radiologist whether the line could be replace through the existing access site.

19.  DISSEMINATION AND IMPLEMENTATION

This policy has been updated by the Infection Control Team, agreed by the Control of Infection Committee and ratified by the Clinical Governance Committee. The policy will be available on TrustNet.

To reduce the incidence of CR-BSI's all healthcare professionals who undertake PICC line management will receive training and demonstrate competency in accordance with this policy.
20. PROCESS FOR MONITORING COMPLIANCE WITH THE EFFECTIVENESS OF POLICIES

This policy will be monitored by auditing infection rates in PICC lines within the Trust.

21. EQUALITY IMPACT ASSESSMENT

The Trust has a statutory duty to carry out an Equality Impact Assessment (EIA) and an overarching assessment has been undertaken for all infection control policies.

22. ARCHIVING ARRANGEMENTS

This is a Trust-wide document and archiving arrangements are managed by Quality Dept. who can be contacted to request master/archived copies.

23. REFERENCES

# APPENDIX 1

**Competency:** Accessing peripherally inserted central line (PICC)

**Standard Statement:** The Registered Health Care Professional will be competent in accessing the device for administration of medication, flushing and blood sampling. To be able to perform the activities satisfactorily without supervision or assistance with acceptable speed and quality of work. Also must have attended IV Study Day and been signed off as competent.

The following policies must have been read in conjunction with completing this competency:

- Aseptic Technique
- Blood Culture Policy
- Central Venous Catheter (CVC)
- Peripherally Inserted Central Line (PICC)
- Tunnelled Central Venous Access Devices (Hickman)
This sheet must be completed in order to validate competence: (Copies of this sheet should be kept in the practitioners department file and sent to the practice development team on the link corridor)

In signing here you the Assessor are confirming you are satisfied that the named practitioner has completed all assessments below to the agreed standard and is competent.

Accountability for Practice: Nursing and Midwifery Standards of conduct, performance and ethics for nurses and midwives (NMC, May 2008)

“The people in your care must be able to trust you with their health and wellbeing.” To justify that trust, you must:

- make the care of people your first concern, treating them as individuals and respecting their dignity
- work with others to protect and promote the health and wellbeing of those in your care, their families and carers, and the wider community
- provide a high standard of practice and care at all times
- be open and honest, act with integrity and uphold the reputation of your profession.

“As a professional, you are personally accountable for actions and omissions in your practice and must always be able to justify your decisions”
